

FED and CHIPS GATEWAYS – high value plus high added value

Successfully processing client payments is not easy. Customers want high value payments made on time and cost-effectively. You also need to handle high volumes, manage inquiries, monitor system traffic – and do it all with tools and technologies that will cope with future change.

Dovetail's Payments System gateway products let you transfer funds from your internal systems and third party applications across the major United States clearing systems: the Federal Reserve's Fedwire funds transfer service and the Clearing House Interbank Payment Systems (CHIPS).

Our IP certified Fed and CHIPS gateways include intuitive interfaces that give you complete functional control while automating operational features such as parsing and rendering all Fed and CHIPS message types, both payment and administrative.

Built on a modern J2EE and Relational Database architecture, the gateways give access to all message data at the field level. These products are configurable, and provide out-of-the-box support

for routing messages to other systems via MQ or JMS. The gateways can be deployed standalone or included as an integrated component of the Dovetail Payments System.

Monitoring and management made easy

Dovetail's comprehensive web-based Fed and CHIPS gateways let privileged operators control clearing system links, monitor traffic and general status of the gateways, create Administrative Clearing System requests and search and display all Fed and CHIPS message types. Privileged users can also perform appropriate actions on specific transactions right from the front-end.

Dovetail

Progressive renovation in payments.
